KLIP SYSTEM - A new qualitative standard in fastening

The requirements relative to product safety and the safety of the packaging operators are less than with traditional fastening systems such as nails. In addition, the consignee receiving crates that are closed with nails or other similar systems find it difficult to open the crates which can also be necessary for customs inspections or likewise, on a number of occasions.

Net-p@cking has analysed this problem and has created a solution that is favoured by many businesses which have noted the following advantages:

- Use offers significant increases in safety for operators.
- In line with safety regulations such as 626/94.
- Increases the safety of the packaging thereby avoiding possible problems of fastening with nails and screws.
- Provides a good capacity for impact absorption.
- Reduces the time necessary to close the crate.
- Avoids the inconveniences caused from the impossibility of opening the crate after fastening it

ADVANTAGES

- > Avoids the risk of damaging the contents from un-riveting the panels with tools.
- > Avoids the dangers of an inadequate and difficult to control closure.
- > Avoids buying and managing nails, screws, nail-guns and the similar.
- > Not necessary to have an area that is equipped for fastening (e.g. the presence of air compression equipment).
- > Crates can be reused
